# Project Scope - Sony MZ1

The scope of this project is to create an app that enables the user to create and take part in different kinds of challenges with coworkers, friends or family.

The users will be able to create their own challenges for work, school or private matters, for example a training challenge that consists of making the most push-ups during a week or who has been running the longest. To keep track of potential movement challenges, the user can be tracked using GPS-tracking. The users can log their own results manually for other types of challenges.

The external stakeholder of this project is Sirada Kaewchino (student at Chalmers) who thought of this idea so that groups can do things together while covid-19 is still ongoing.
